Best Password Managers

As the services we use online continue to increase, it is hard to keep track of all the different passwords that you set up for each account. Combinations of alpha numeric strings are hard to remember, and using the same password for multiple accounts leaves you vulnerable to data breaches. So how do you stay organized? Stimulus Technologies has taken a look at some great password managers that will help you achieve the task and stay secure.

LastPass (lastpass.com)

LastPass allows you to securely store all of your passwords and sync them between all of your devices so you don't have to enter or remember the passwords again. You just need one master password, download the LastPass software on the device, laptop or computer you are using and sign in with your account. LastPass has three plans, the free or basic version allows you to use this tool on your desktop and laptop computer, the premium version for \$12 per year allows you to go mobile and use the password manager on your cellphone or tablet. Finally the Enterprise version starting at \$24 per user per year allows your team to use the password manager across all of their devices, add multifactor authentication, generate secure passwords, onboard and offboard employees quickly, receive automated breach alerts on vendor's websites, and much more.

LastPass is easy to use, has had minor hiccups, uses 256 bit AES encryption and is supported across Windows, Mac and Linux platforms. It also supports the following browsers: Chrome, Firefox, Opera, Safari and Internet Explorer and the mobile app is available at the App Store, Windows Store, Blackberry App World and Google Play.

RoboForm (roboform.com)

RoboForm has been around since 1999, being one of the first in the industry to provide a password management solution, the company has evolved throughout the years providing military-grade AES 256 encryption, cross-browser support, synchronization across all devices, easy one click logins, form filler, 24/7/365 customer support and more...

Tip of the Month:

If you are on a hurry, you can quickly lock your computer by hitting the Windows key and L on your keyboard. This will lock your computer and prompt you for a password when you return.

[Small Business Security Part 5 - Data Loss](#)

On this fifth, seven part series, Nathan explains how data loss can affect your business and what measures to take to avoid losing important information. He also explains why we recommend offsite backup services. Click below to watch the video.

[What does EMV Chip Technology mean to your business?](#)

Did you know that as of October 2015 merchants will be required to adopt a new credit card processing technology called EMV? [Click here](#) to find out what this means for your business. This information is provided by Danielle Seales from MLS Network.
